

Reflection

This was a fun project, since Figma is all new to me, I would play a lot around and test different things to get to know Figma better. And this would also lead to things I thought would fit the project.

It was also quite overwhelming, because just moving around in the Figma file needed some skill. There was and is a lot to learn and master in the program, and I feel that using it more will make the design process easier.

Starting with the low-fidelity prototype made it easier to have something to start working with. I have never worked with any design, so I looked at some online stores for inspiration and saw a lot of the same design patterns, which I have tried to incorporate in my prototype. The first sketch was somewhat easy because I didn't think too much about the look, rather that the frames were following normal design patterns. Like a hamburger menu for the mobile frame and organized cards when looking through the products.

I felt that navigating Figma was very hard and frustrating, but I mastered it more eventually and then it was much easier and faster to work with the program. I used AI to help me troubleshoot when something didn't work out in Figma, and that was very helpful and I learned a lot.

I thought the color selection process was the easiest, I used the color wheel to find a nice contrasting color to the logo color. And I thought the bright orange would be sporty and fresh. But when I started to build the prototype, I found it difficult to make the colors work well. There were a lot of contrast in the blue and orange, so I tried to avoid using them on top of each other. I had visions, but wasn't able to get them right. I wanted the frames background to be in the dark teal logo color to make it look tough, but it didn't work out as the design looked too cheap and also too much light text on dark background is too exhausting to read. I used a lot of time testing different ideas, the darker theme, switched to white background, I tried simple and minimalistic and also more extreme looking. I think the problem was for me that I don't know much of the brand's identity and struggled with the target audience. I decided to make it a bit more action filled, than beautiful, with harder edges, not rounded corners. Typography with italic style, made it more "moving" and fast, I also thought about making underline a part of the headlines to make it highlight the technical part of the brand (for example:

THIS_LOOKS_TECHNICAL), but I did not think it worked on this site as it just looked like some error.

My header is now in the primary logo color, but it was earlier the blue sky from the hero image with a vague overlay, and I thought it look cool and pretty, but it didn't fit the brand's jackets and the rest of the theme I decided on. I thought about it, the design is for the brand, and not for me, and this might be a bit difficult when designing different sites. Some webpages may need to be clean and straight forward, like government sites for example. So, I struggled a bit with that.

The imagery I think worked great, the hero image is in a contrasting color and gives a fresh outdoorsy look. The two other images I used were AI made, with me wanting to include happiness, rain, logo colors, and fresh nature. I was happy with the AI generated images, but would not use them as a hero image, because I think AI would shine thru when the images are

too big and in the center of attention. Also, all product images and hero images were compressed.

In conclusion, I am still not quite happy about the design, as I think it looks too bulky and easy and looks a bit like it is made in Windows Paint.

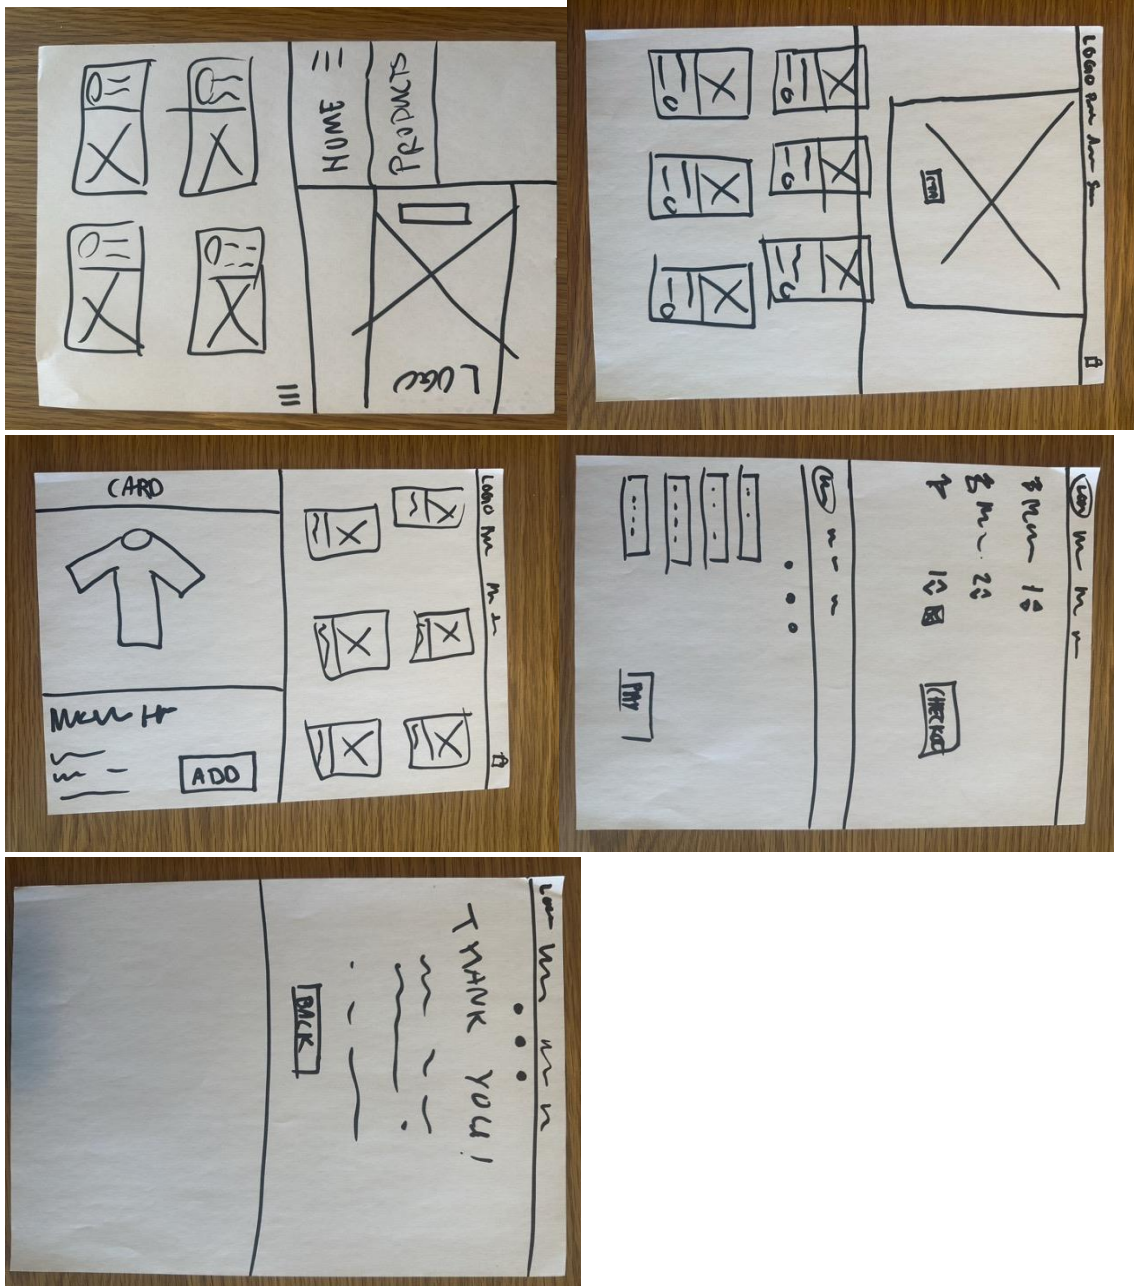

I don't have any existing skills in this, but I have done a lot of online shopping, so I made sure to include what I like the most from other online stores. For example, the possibility to easily add to the bag and keep scrolling through the products without having to go into a new page with product details. And the possibility to scroll through some of the popular products on the front page.

All in all, I am happy about the result considering it's my first prototype. I think it's very interactive. And I think I included a lot of elements, from the course like easy and safe navigation, with breadcrumbs, a lot of ways to return and a page control bar in the payment process. I would love to add more elements like filtering the product list, more pages, and categories. But I think in my case less is more, until I master Figma and design better. But an easy and functioning prototype, and I think the vision is OK for a first prototype. I am very happy and proud of having made this when I knew nothing about it earlier.

AI log

- Used mostly Claude Anthropic, for imagery I used Freepik and Figma
- Clarification of exam requirements (pages, interactions, deliverables). Helped me make sure to include everything required
- Creating a work plan for the Rainy Days assignment. Helped me structure the work progress.
- Understanding the layout grid settings and troubleshoot when I couldn't make it work.
- Prototyping interactions when scrolling through one grid. Taught me how to use smart animate to make the illusion of scrolling.
- Asked a lot of questions on how to do different things in Figma that we had already been thru in the module, but I could not remember. Helped me repeat and learn better.
- Used AI to make imagery and text for the brand, based on my own prompts on what I believed would fit the brand.
- Understanding what the AI log should contain
